

# Skybox® Firewall Assurance

## Highlights of Release 5.5

### Firewall Assurance Overview

Skybox Firewall Assurance allows IT operations and security managers to automatically assess their firewall compliance status in minutes, reducing firewall maintenance and compliance costs. Customers can visualize and pinpoint potential risk exposures that need immediate attention, including conflicting firewall rules and misconfigurations, and track historical changes in access rules and objects.

### Highlights of Skybox Firewall Assurance 5.5

**Palo Alto Networks Support** – The network model used by Skybox Firewall Assurance has been enhanced to incorporate the granular user and applications control data provided by Palo Alto Networks firewalls. Firewall Assurance now takes into account user and applications settings when conducting firewall rule analysis, policy compliance audits, firewall change tracking and network access path analysis. This allows customers to easily establish policies that contain these specific security controls, plus verify that these controls are being used effectively to protect against cyber threats and misuse.

See the Palo Alto Networks/Skybox Security joint solution brief for more information.

**Configuration Compliance** – Users are now able to utilize configuration checks to test for best practices and for platform security of firewalls. Predefined policies are available for platforms such as Cisco, Check Point, Juniper, Fortinet, Palo Alto Networks, and others. Users have the capability to fully customize all policies so that custom checks can be added for different devices.
